EXPERIMENT

Title

ENCODE THE NUMBER

Description

You work in the message encoding department of a national security agency. Every message that is sent from or received in your office is encoded. You have an integer N, and each digit of N is squared and the squares are concatenated together to encode the original number. Your task is to find and return an integer value representing the encoded value of the number.

input1: An integer value N representing the number to be encoded.

Output :

Return an integer value representing the encoded value of the number.

Sample Input:

167

Sample Output:

13649

Source Code:

```
def encode_number(N):
    str_N = str(N)

    squared_digits = []

    for digit in str_N:
        squared_value = str(int(digit) ** 2)
        squared_digits.append(squared_value)

    encoded_string = ''.join(squared_digits)

    encoded_value = int(encoded_string)

    return encoded_value

N = int(input().strip())

result=encode_number(N)
print(result)
```
